Experiment 6: Online Cake Ordering Website

1. Aim

To design a responsive front-end prototype of an online cake ordering website in which customers browse, search and filter cakes, customise size and message, add to cart, place orders with a shipping address and track delivery, and the admin manages products, orders and shipping status.

2. Algorithm

1. Customer searches by name and filters by category, sub category and maximum price; the list shows only matching cakes.
2. On the details page the customer selects size (kg) and an optional message, then adds the cake to the cart.
3. Amount of a cart line = price per kg x size; the cart total is the sum of all lines.
4. At checkout a saved shipping address, delivery date (from tomorrow) and payment method are chosen and the order is created with status Order Placed.
5. The admin updates the status (Order Placed, Preparing, Out for Delivery, Delivered); each status has a shipping location.
6. The customer sees the same status and location in My Orders > View Shipping Status.

3. Procedure to Run

1. Copy the file exp6_cake.html to any folder.
2. Double-click the file; it opens in Chrome or Edge. No installation is required.
3. To edit, right-click the file, choose Open with Notepad, change the code, save and refresh the browser.
4. Log in with any user name and password. Choose the role (user or admin) on the login page.

4. Code

exp6_cake.html

```

</html>
```

6. Output

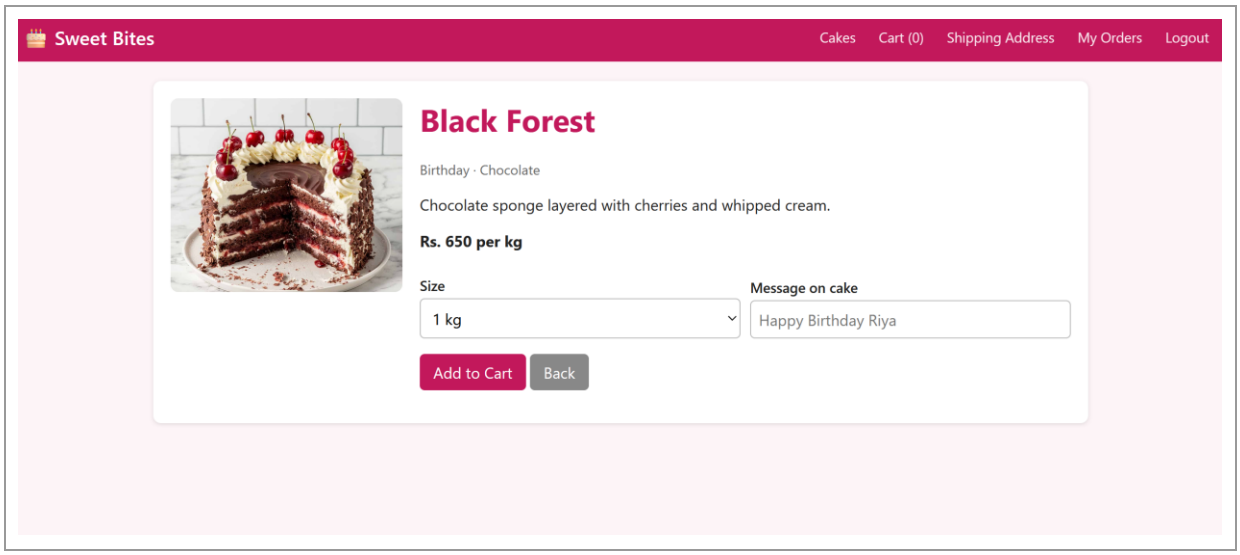

Output 1: Login page

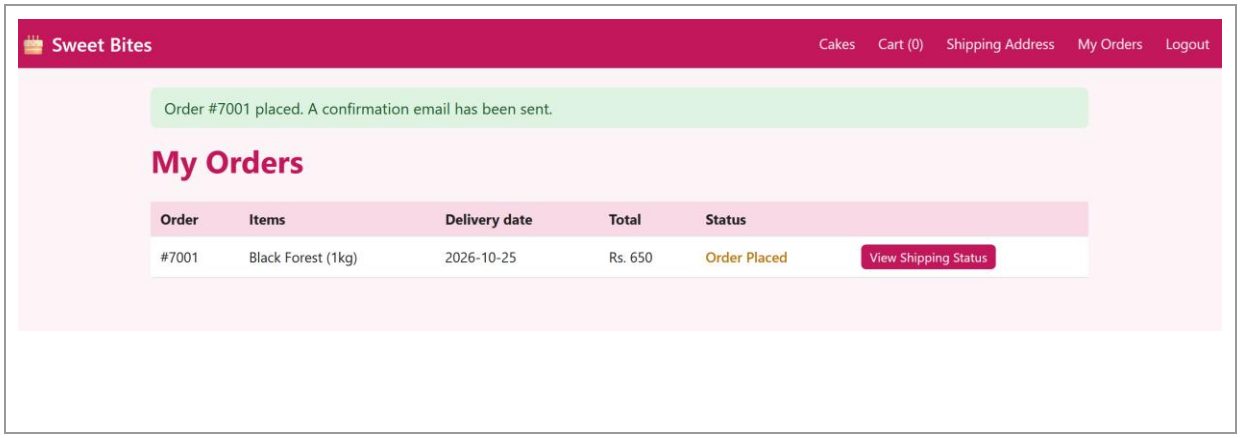

Output 2: Browse cakes with search and filters

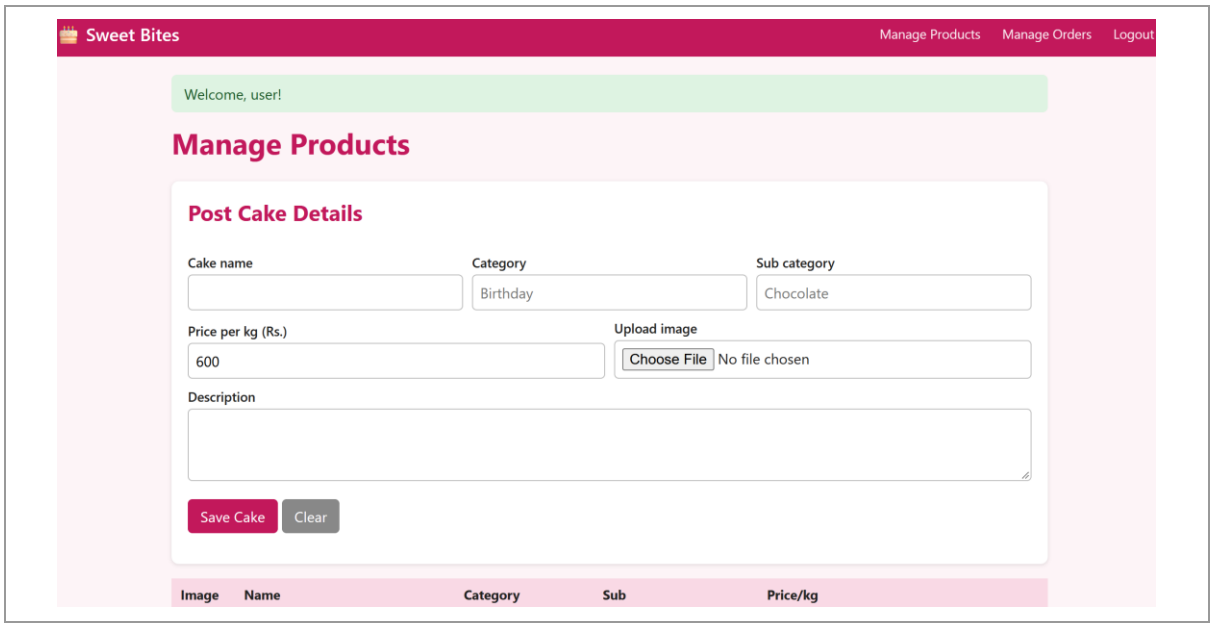

Output 4: Cake description page

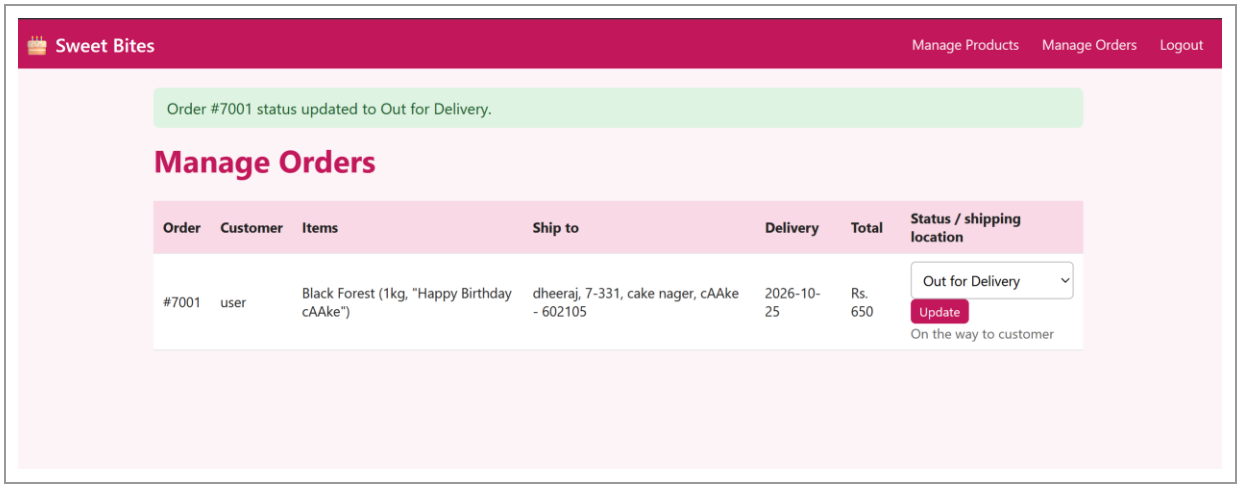

Output 5: Place order

Output 6: Admin: manage products and upload image

Output 7: Admin: manage orders and update status

8. Result

The online cake ordering system prototype was designed and tested successfully; all the listed pages and features work in the browser.
